MARKET SURVEY NOTES

A. Survey Coverage

1. The market survey was carried out in 5 towns which was an improvement compared to the 3 towns covered in previous market surveys. In this regard, Eldoret and Bungoma towns were added to the list of Nairobi, Mombasa and Kisumu. Data was collected from 3rd to 14th April, 2017.

B. Calculation of Prices Averages for Different Towns

2. Five (5) outlets were targeted per category in all the five (5) towns apart from Nairobi where ten (10) outlets were targeted. A questionnaire was then prepared describing the various items and distributed to the selected outlets.
3. Data entry and cleaning was then done to pave way for analysis. During analysis, four variables were calculated; namely **Geometric Mean, Standard Deviation, Coefficient of Variation** and the **Count**. The variables were calculated as follows:-

(a) **The Geometric mean** of prices was calculated by getting the product of the values and taking the n^{th} root of the product (as opposed to the arithmetic mean which uses the sum of the values divided by n) where n refers to the number of observations.

(b) **The standard deviation**- a measure of dispersion was calculated to show how far data sets deviate from the group mean. The standard deviation was used to calculate the coefficient of variation (CV).

(c) **The Coefficient of Variation (CV)**

The coefficient of variation is a measure of spread that describes the amount of variability relative to the mean was calculated by dividing the standard deviation by the mean and multiplying by 100. For this survey, a CV value of 30 was used to identify and eliminate outliers.

If the value of the calculated CV was greater than 30, the highest or lowest price for the item was removed. This process was

repeated iteratively for purposes of ensuring that the prices of items were not very far from each other.

(d) The Count

A Count is simply the number of valid prices which were used to calculate the mean. In this case, valid prices are prices obtained after eliminating the outlier prices as indicated by a CV Of 30. For example, if we have 20 prices for an item and the calculated CV is 35, then we have to remove the outlier prices (lowest and highest prices) until the CV of 30 is achieved, say we eliminate 4 prices. Then the valid prices for that item would be the remaining 16 prices with a CV of 30.

4. Once the calculated value of CV was 30 or less, then the mean was reported if:-

(i) In each town, the count of remaining prices was 3 or more and for the overall mean, the count of remaining prices in all towns was 10 or more.

(ii) In cases where there were less than 3 prices for a specific item in a town, then the mean price for the item was viewed as prone to bias and was therefore excluded from the report.

(iii) Similarly if the total number of observed prices for all towns for an item was found to be less than 10, then the overall mean for that item was not reported.

5. The overall mean (all columns) in this report is the mean for all valid prices for that item, including the prices which were valid but were not used to calculate the mean for the item in the town because the number of prices was less than 3.

6. For instance, if two towns reported two prices each for an item, the mean for this item in the towns was not reported. If the other three towns reported 3, 5, and 6 prices respectively for the same item then the mean for this item was reported for the three towns. The overall mean for this item will be based on 18 prices (i.e. $2 + 2 + 3 + 5 + 6$) since these are the valid prices for this item. In short the overall average is based on all valid prices of that item and is not equal to the average of the five means for each town.

7. The brand names were solely mentioned to emphasize the specificity of the survey. **Therefore, the stated brand names are not an exclusive**

recommendation or prescription by PPRA to public entities, but are merely mentioned for the purpose of information.
